

Citrix Desktop and Application Delivery Solutions

Make IT as dynamic as your business

Citrix provides the tools and services needed to meet all of the IT requirements and challenges inherent in a virtual workforce. Citrix solutions give organizations the ability to drive business from anywhere, including the branch office, home office, factory floor, customer site or on the road. With this comprehensive IT solution, organizations can reap all of the benefits that a virtual workforce provides, giving them a real competitive advantage.

Organizations can:

- Easily and securely deliver desktops, applications and collaborative tools to any worker, anywhere

Citrix solutions centralize, virtualize and securely deliver desktops, applications and data to workers on-demand, anywhere, over any connection and on any device. Virtual collaboration tools help users work together effectively across distances. Streamlined support and management processes keep costs low while accelerating and increasing worker productivity.

- Deliver a high definition access experience no matter where users work

Citrix application acceleration and WAN optimization solutions provide high-definition desktop and application performance to all workers.

- Ensure availability of essential IT resources for all users

A flexible virtualized environment enables IT to perform regular system maintenance without disrupting on-going work, adapt rapidly to changing conditions and recover quickly and seamlessly from service interruptions. Centralized management tools speed support to keep users up and running, and new users can be added easily.

On the desktop

Citrix XenDesktop

Citrix XenDesktop virtualization capabilities and on-demand applications by XenApp provide today's dispersed workforce the flexibility to work from anywhere at any time using any device. Leveraging Citrix Receiver as a universal client, workers can access their desktop and corporate applications from any PC, Mac, netbook, thin client or smartphone. This enables complete workplace flexibility, business continuity and user mobility. Users can also add or remove any application through the world's first self-service enterprise app store.

On the network

Citrix Access Gateway

Citrix Access Gateway provides administrators granular application-level access control, while allowing workers to work from anywhere. It gives IT a single point to manage access control and limit actions within sessions based on both user identity and the endpoint device, providing better application security, data protection and compliance management.

Citrix Access Gateway allows users to securely access desktops and applications using any device in any location, including home computers, kiosks and mobile devices. It enables user sessions to transparently and securely move between networks and devices by dynamically adapting access and available actions as the users roam different networks and switch to different devices. Citrix Access Gateway gives users high performance access to their desktops, applications and data by integrating security and acceleration in a single client with Citrix Receiver.

In the datacenter

Citrix XenDesktop and Citrix XenApp

Citrix XenDesktop and Citrix XenApp enable IT to centralize, virtualize and instantly deliver desktops and application to users on-demand. Applications are installed and updated once in the datacenter and instantly delivered to users anywhere, dramatically simplifying desktop and application management for IT.

Citrix XenServer

Citrix XenServer creates a virtual server environment that supports all business-critical applications, and provides desktop and application access on-demand across an organization's virtual workforce. With XenServer, you can virtualize XenDesktop to increase virtual machine density, supporting more virtual workers without increasing physical servers, cost or complexity.

This also accelerates the delivery of server workloads which dramatically improves IT agility, simplifies on-going IT administration, and increases savings in power, cooling and management costs. By dynamically provisioning new application workloads from a golden server image, XenServer speeds the delivery of desktops and applications to users in any location across a virtual workforce.
